**A bespoke, artisan,
hand crafted, organic,
grass-fed SELinux
Workshop**

Overview_

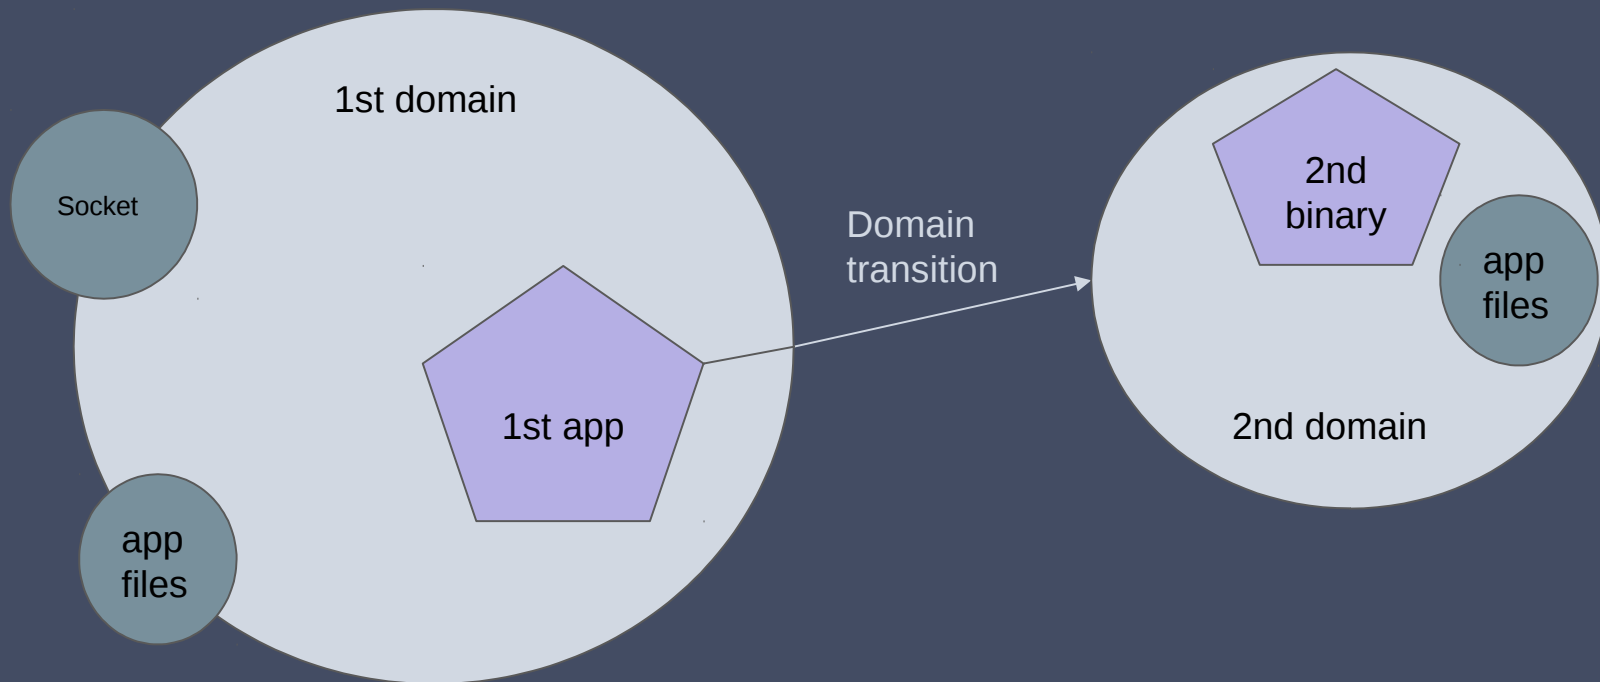

- # Quick intro to the concepts of SELinux
- # Overview of tools and approach for policy creation
- # Introduce our vulnerable “test subject”
- # Get-stuck-in
- # Review
- # Discussion of a real-world policy (if time permits)

SELinux concepts_

- # Mandatory Access Control
- # Labels
- # Domain transitions

An example setup_

Key things you need to know about_

Tools

- # sestatus
- # setenforce/getenforce
- # sepolgen
- # semodule
- # audit2allow/audit2why
- # ps -Z / ls -Z
- # chkcon/restorecon

Important Locations

- # /etc/selinux/config
- # /var/log/audit/audit.log
- # /usr/share/selinux/

There's a lot -

<https://github.com/SELinuxProject/selinux/wiki/Tools>

Common things in a SELinux policy_

selinux-policy/

└─ policy.fc	----->	list of files your policy targets
└─ policy.if	----->	macros
└─ policy_selinux.spec	----->	rpm build spec
└─ policy.sh	----->	helper script
└─ policy.te	----->	the SELinux policy

policy.fc: file_contexts file_

/home/foo(/.*)? --

gen_context(system_u:object_r:web_exec_t,s0)

filepath

type

file label

- user : role : type

- Multi-Level Security (MLS) -> # trivia: Bell-LaPadula Model

policy.te: type_enforcement file_

Some points of
interest

```
# <x>_<y>_<z>( ...  
# allow <type x> ...  
# permissive ...
```

```
1 policy_module(shellcode-web, 1.0.0)  
2  
3 #####  
4 #  
5 # Declarations  
6 #  
7  
8 type shellcode-web_t;  
9 type shellcode-web_exec_t;  
10 init_daemon_domain(shellcode-web_t, shellcode-web_exec_t)  
11  
12 permissive shellcode-web_t;  
13  
14 #####  
15 #  
16 # shellcode-web local policy  
17 #  
18 allow shellcode-web_t self:fifo_file rw_fifo_file_perms;  
19 allow shellcode-web_t self:unix_stream_socket create_stream_socket_perms;  
20  
21 domain_use_interactive_fds(shellcode-web_t)  
22  
23 files_read_etc_files(shellcode-web_t)  
24  
25 miscfiles_read_localization(shellcode-web_t)  
26  
27 sysnet_dns_name_resolve(shellcode-web_t)
```

Learning mode_

```
# sestatus
# getenforce
# setenforce
# <editor-of-choice> /etc/selinux/config
```

```
# This file controls the state of SELinux on the system.
# SELINUX= can take one of these three values:
#   enforcing - SELinux security policy is enforced.
#   permissive - SELinux prints warnings instead of enforcing.
#   disabled - No SELinux policy is loaded.
SELINUX=enforcing
# SELINUXTYPE= can take one of three two values:
#   targeted - Targeted processes are protected,
#   minimum - Modification of targeted policy. Only selected processes are protected.
#   mls - Multi Level Security protection.
SELINUXTYPE=targeted
```

```
# cat /var/log/audit/audit.log | audit2allow -m <mod>
```

This command is so valuable, it will tell you all the violations that were found in your testing and format them for copy-paste into your policy

Type transitions_

**type_transition source_type
target_type : class default_type;**

e.g. *type_transition web_exec_t
web_bin_t:file web_t;*

\$./shellcode_eater 4831c004990f05

This application is super vulnerable, it might also be crap code too. But, if you feed it assembler hex it will exec it 🤖

We're going to try to limit:

- # bad things it can do
- # badnesses that can be done unto it

```
void main(int argc, char **argv) {
    if (argc != 2) {
        printf("Please provide shellcode input\n");
        printf("example usage: ./shellcode-eater \"cccccc\"\n");
        exit(1);
    }

    char *data = argv[1];
    size_t datalen = strlen(data);
    char *code = malloc(datalen / 2);

    int j = 0;
    char tmp[3] = {0};
    for (int i = 0; i < datalen; i += 2) {
        tmp[0] = data[i];
        tmp[1] = data[i + 1];
        long number = strtol(tmp, NULL, 16);
        code[j] = (char)number;
        j++;
    }

    int (*func)();
    func = (int (*)(void))code;
    (int)(*func)();

    free(code);
}
```

WEB 2.0_

```
shellcode_eater.webz

```

I've created a website for us to try and protect with SELinux based on the previous tool

Lets get going_

Vagrant/VBox (*recommended*):

<https://github.com/cmdinc/selinux-workshop/tree/master/vagrant>

Painpoints: labelling_

You can go very wrong if you don't have a plan for what files should be in which distinct contexts/domains.

Spend time upfront thinking about that so you don't fall into a trap!

Painpoints: relabelling_

Things to try when relabelling doesn't work!

- # try ``chcon -v <user>:<object>:<type <yourfile>`` and see what it says
 - If that works, then you have an issue with your ``policy.fc`` file labels
 - When your policy works ``restorecon -F -vv <yourfile>`` should change the labels
- # Always have a ``tail -n1 -f /var/log/audit/audit.log`` running just in case
- # To debug whether your file-contexts are even on the system try:
 - ``semanage fcontext -l | grep <my labels>``
- # Double check your helper script ``policy.sh`` has included `restorecon` for the newly updated fc files, it's a common mistake I made

Painpoints: relabelling 2.0_

- # SELinux doesn't execute regex matches by most specific ☹️
- # Therefore you may need to go hunting for what is messing with your restore, or just create your directory somewhere that doesn't conflict

Advanced: macros_

These help when:

- # You have repetitive things applying to many domains
- # Want to share/reuse some complex config across SELinux policies

The GNU M4 macro syntax is weird
IMO

** Just note, ` == push, ' == pop*

```
50 #####
51 ## <summary>
52 ## Allow type_t to teardown shm and sockets
53 ## </summary>
54 ## <param name="type">
55 ## <summary>
56 ## This macro allows things like shutdown_t access to close the cmd_daemon sock
57 ## </summary>
58 ## </param>
59 #
60 interface(`cmd_daemon_t_shm_destroy`,`
61     gen_require(`
62         type cmd_daemon_t;
63         class shm { destroy read unix_read unix_write write };
64         class unix_stream_socket connectto;
65     `)
66
67     allow $1 cmd_daemon_t:shm { destroy read unix_read unix_write write };
68     allow $1 cmd_daemon_t:unix_stream_socket connectto;
69 `)
```

Thanks for your time

Slides + webapp + shellcode_eater + the policy
Can be found at:

<https://github.com/cmdinc/selinux-workshop>

I also plan to add more updates to that repo with
some current work I'm doing on "how to
integration test SELinux policies"
